2026-10-22 • IT/EN • DEVELOPMENT EDITION

Getting started

Quorivio lets you present polls and quizzes independently of your PowerPoint or PDF. The presentation can stay in your usual program. The presenter controls the session in a browser; participants join through their mobile browser.

Use the QR code, link or access code shared by your presenter. A separate public screen can display aggregated results.

Join a session

Open the URL encoded by the presenter’s QR code, or type the session code on Quorivio’s main page. Choose Join to enter the session. No user account is needed for anonymous participation in this development version.

Keep the browser tab open during the activity. If you reconnect, the session may require rejoining; preserve the session link.

Answer a poll or quiz

Wait until the presenter opens an activity. Select your preferred option and submit it. An acknowledgment indicates receipt. Avoid tapping submit repeatedly. The activity may close or a quiz timer may expire.

For quizzes, time and scoring are managed by the server; check with the presenter for any game rules.

Present a session

Sign in as a presenter, create a session, add a poll or quiz and download the QR code in PNG or SVG. Insert the QR into any external presentation, without importing the slide deck. Activate the session, open and close activities and display the public results view.

CSV export is available from the session dashboard. Data survives a normal service restart when the database is persistent.

Privacy, accessibility and current limitations

The QR code is for public participation, not presenter authorization. An anonymous browser session does not guarantee one vote per physical person. Only share the public URL, not account passwords. Results may be projected to the audience.

This is version 0.1.0-dev: external identity providers, presentation import, full accessibility certification and end-to-end deployment validation are pending.
