QUORIVIO

Participant guide

Version 0.1.0-dev · Build dev-20261022 · 22 October 2026

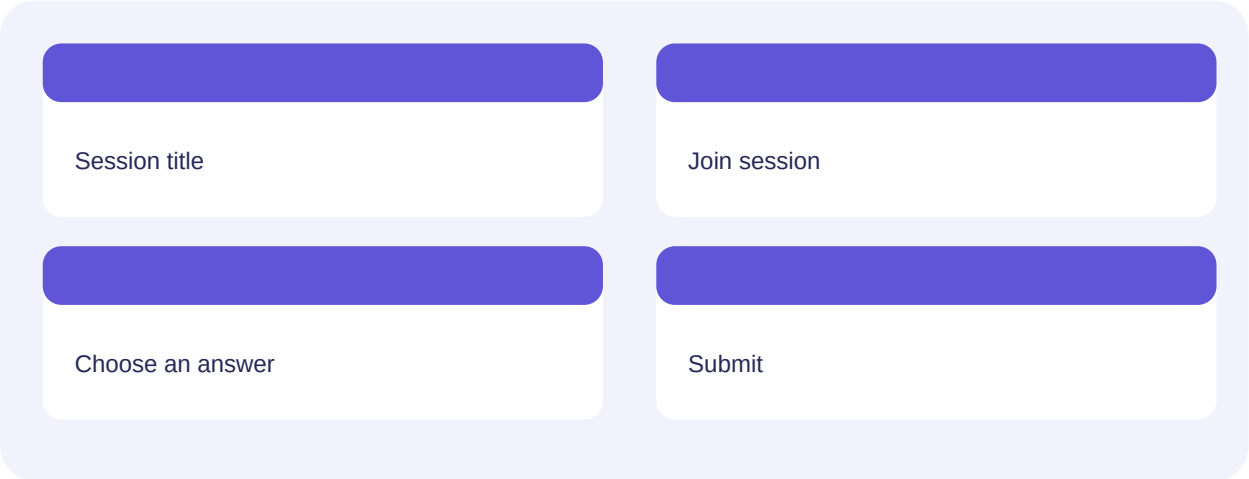

Alessandro De Salvo · github.com/desalvo/quorivio

Documented features match the development build; unverified and planned operations are explicitly marked.

Getting started

Requirements

Use a modern browser on a smartphone and a connection to the Quorivio service. No PowerPoint plugin is needed, and anonymous participation does not require signing in.

Roles and privacy

The presenter determines when activities are open. Confirmed responses are retained subject to configured retention rules. Anonymous display does not imply that all technical data is absent.

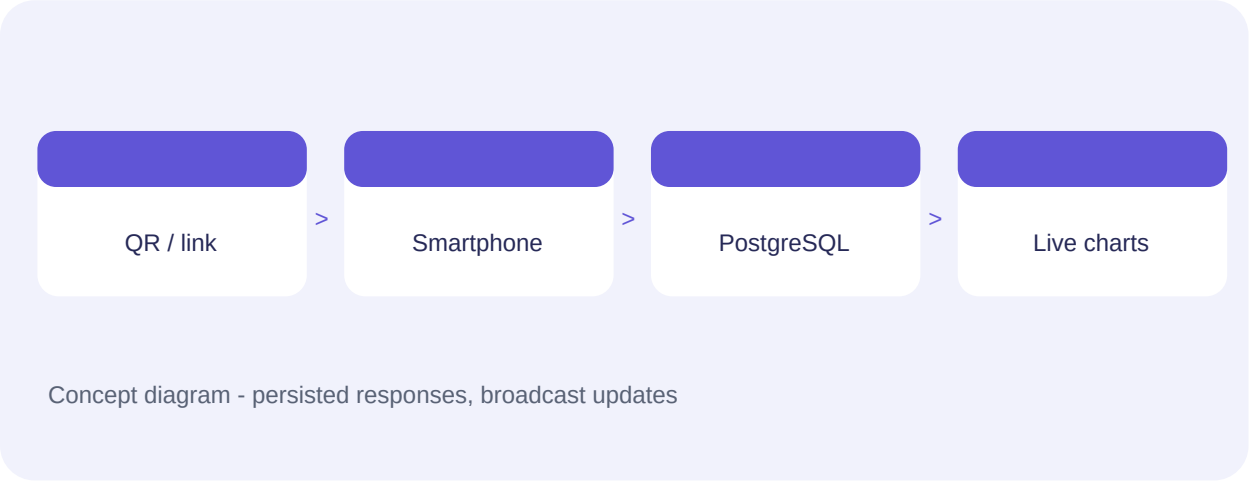

Joining a session

Scan a QR code

1. Open your phone camera. 2. Scan the QR code shown by the presenter. 3. Open the link. 4. Tap Join. The QR code contains only a participation URL.

Enter a code

1. Open the service landing page. 2. Type the session code shown by the presenter. 3. Select Join, then enter the session. Expired or revoked access codes must be replaced.

Polls and quizzes

Respond to a poll

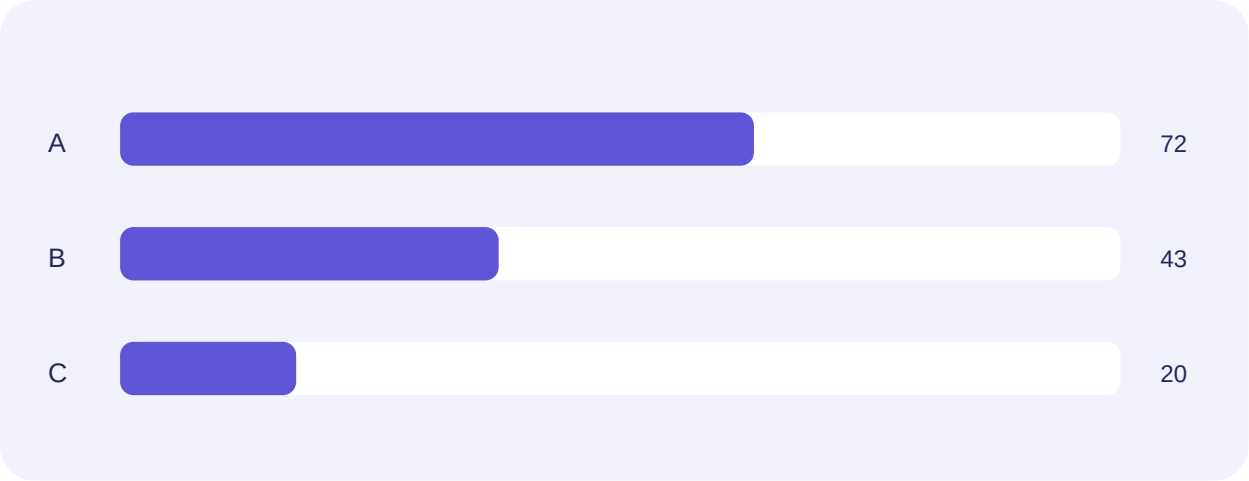

Select one option while the activity is open and tap Submit answer. Wait for the confirmation message; the response is validated and saved server-side.

Take a quiz

Select and submit an answer before the quiz is closed. Where enabled, timing is checked on the server. Correct answers are not exposed to participants prematurely.

Connection issues

If disconnected, reopen the same invitation in the same browser to preserve your participation identity where possible. Avoid duplicate submissions if the server has already acknowledged the answer.

Example chart — illustrative values, not live data.

Privacy and troubleshooting

Personal information

Do not provide unnecessary personal data. For data-rights requests, contact the controller identified by the organization operating Quorivio.

Common issues

Unavailable session: check the link and expiry. Closed question: contact the presenter. Missing updates: check connectivity and reload. Use browser zoom and keyboard navigation as needed.

Identity, pseudonyms and necessary cookies

Join anonymously

When anonymous access is enabled, provide a 2–40 character pseudonym and accept the necessary functional cookies to preserve participation identity and avoid duplicate submissions. A pseudonym alone does not ensure one vote per real person.

Registered accounts

Local registration is currently an API; the web registration form and signed-in participant workflow are unfinished. Registered accounts require administrator approval.

Guided walkthrough: from invitation to confirmed vote

Practice scenario

Requirements: presenter QR code or URL, modern browser with required functional cookies, an active session and an open question. Step 1: open the link. Step 2: verify the session title. Step 3: enter your chosen pseudonym if requested. Step 4: acknowledge necessary cookies. Step 5: submit one answer. Step 6: confirm the success message before leaving.

Reopening the browser

Return using the same browser and link; do not erase session cookies. Private browsing, changing devices or clearing site data may prevent recognition. Anonymous access cannot guarantee one vote per natural person.

When questions change

Keep the external slide deck in its own app. The Quorivio link follows the current activity. If it does not update, check the connection, refresh once and ask the presenter whether submissions are closed.

Live feedback

Aggregate results may be visible or hidden according to presenter settings. No chart on your device does not mean a confirmed response was lost; rely on the response confirmation.

Troubleshooting common participation problems

The QR is not recognized

Use the presenter-provided text URL or session code. Do not disclose nonpublic links outside the event. If the link was revoked, ask the presenter for a new one.

No question appears

The activity may not yet be open, or it may have been closed. Do not attempt to bypass an activity window; ask the presenter which question is active.

A duplicate vote is suspected

Avoid repeated clicks on Submit. The backend attempts to protect retries; an anonymous pseudonym cannot guarantee real-person uniqueness. Report inconsistencies to the event organizer.

Accessibility

Use browser zoom, keyboard navigation and assistive technologies. Request text alternatives for inaccessible images, videos or PDFs; color alone should not determine meaning.

Privacy and support

Necessary cookies

Functional cookies associate a browser with its participant session and help reduce duplicate submissions; the pseudonym is provided by the visitor. Acceptance of necessary cookies is not consent to profiling or advertising.

Do not submit sensitive data

Avoid passwords, identity numbers, health information and confidential data in text answers unless the organizer has established a lawful, documented purpose. Some GDPR functions remain incomplete in this development build.

Data-subject requests

Contact the instance operator or controller identified in its privacy notice. Provide the event date and pseudonym, but never your password. Organizational procedures determine how requests are handled.

Word cloud and moderated Q&A (new)

Contribute a word

Join using the QR code and your pseudonym. When the presenter opens an activity, type one word or short phrase of up to 48 characters under Interactive tools and press Submit word. One contribution is allowed per participant per activity.

Ask a question

Type 5–500 characters and select Submit for moderation. Up to three questions are allowed per activity. Your question remains private until approved by an authorized presenter.

Upvote a question

Choose Refresh approved questions and use Upvote. Each participant can upvote a given approved question once.

Verification limits

These functions exist in the development build but still require real PostgreSQL, smartphone and WebSocket integration testing.

Streaming uploads and checks

Uploading files

Uploads are progressively written to private storage; type signature, length and default 100 MB limit are checked. Keep the browser open until confirmation. The Compose/Helm deployment bundles antivirus scanning; shared storage is still pending.

Widgets, satisfaction scores and page composition

Manual identity

Application version: 0.1.0-dev. Documentation build: dev-20261022. Git release tags and revision numbers are excluded; they do not require rebuilding manuals if the documented application build is unchanged.

Widget palette

The palette includes a 0–10 satisfaction rating, emoji reactions, text, divider, indicative timer and QR placeholder. Widgets complement rather than replace poll or quiz answers.

Presenter workflow

Open the session, choose Page layout for an activity, select + rating or another widget, edit its label, reorder by drag and drop or keyboard-friendly arrow buttons, then save the layout. Existing answers remain untouched.

Participant workflow

Join with the session QR and pseudonym. Where enabled, choose a number from 0 to 10. One satisfaction response per participant per activity is stored separately from quiz answers and emoji reactions.

Statistics

Use Satisfaction 0–10 in the session view to see an overall count and average and a per-page breakdown. Minimum, maximum and distribution are available through the protected API. Do not disclose participant identities on public screens.

Known limitations

Drag and drop reorders widgets on question pages; freeform spatial positioning and all page types are not yet supported. Timer and QR are visual placeholders. Browser and real PostgreSQL integration tests are pending.

Profiles, collaboration and multiple ratings

Project opening

The workspace clearly distinguishes Author / owner and Invited collaborator for each listed session.

Presenter profile

Load the profile in the Presenter profile area, set the public display name and an HTTPS photo URL, then save. Direct photograph upload is not yet supported; review image rights and consent.

Profile widget

Open Page layout, add + profile, choose a session presenter, and save. Repeat for multiple profiles; Remove deletes individual widgets.

Independent ratings

Insert multiple rating widgets, selecting Question, Quiz, Session or Presenter as their target. Select the presenter where applicable. A participant can score each widget once.

Statistics and limitations

Presenter statistics include a count and average for each widget. The quiz target currently maps to an activity rather than a multi-question quiz. The PostgreSQL schema migration requires live validation.

Visual editing, formatting and comments

Widget options

In Page layout add multiple widgets. Rating widgets require a title and support an optional description. Expand Style and animations to choose font, size (10–96), color, bold, italic, underline, strikethrough, and fade/slide.

Text editing

Double-click the title input to select and edit the text, then save the page. Drag to reorder or use the accessible up/down controls.

Rating comment

Each rating widget requires a title. Participants may write an optional comment up to 1,000 characters alongside a 0–10 rating. Comments remain private and are not included in public aggregates.

Question widgets

Add a question widget in single, multiple, free-text or file mode. In this build it is an additional visual block, not yet an independent response channel.

Limits

A freeform widget canvas is available experimentally; production browser validation is pending, as is fully integrated per-widget media editing. Browser/PostgreSQL verification remains required.

Appendices and known limitations

Status: development. Before operational deployment, review docs/DEVELOPMENT_STATUS.md, docs/GDPR.en.md and docs/SECURITY.md.

Visual diagrams are illustrative reproductions of workflows, not browser screenshots.
